

Theme

Cute animal detectives

- Are we doing pixel art? or actual (AF) graphics

Inspo

- Frog Detective

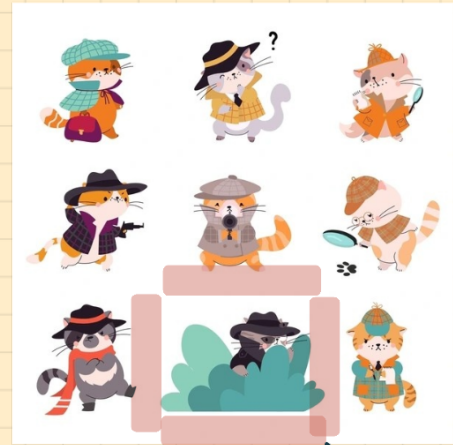

I think this color scheme + style would appeal to both kids and adults.

It's easy on the eyes (pastel)

But not overly cute

↳ Allows slightly more serious story lines

↳ Warm and cozy rather than creepy

Cute but not Dumb (?)

So the game still feels serious → the users take it seriously

General Storyline

- Main Character: Bill the Lizard

- Premise: Was asked by his friend Bunny Detective to look after her shop/detective practice while she went away for a bit but she found a huge clue for a case she'd been working on

But she goes missing and animals are starting to come by the shop (?) for help. Bill now needs to help her customers while also looking for clues regarding the case Bunny was working on

- Gameplay: Bunny leaves Lizard a notebook ^{or he just finds her old notebook} of instructions / helpful tips
↳ This could be the **Side Panel** the user is interacting with

Through this notebook Bunny teaches Lizard all the code/syntax things he needs to learn

Each new mystery unlocks a new page / new mechanics for the player

Hints can be given by "paying" to unlock a page

This notebook is also where the Lizard will write down his findings about the mystery

Stages

Tutorial

• Goal: Find the key to unlock Bunny's desk drawer

(maybe the journal is in the drawer, and this stage is played with the side panel representing a letter-bunny left him or something, or maybe he's trying to eat Bunny's snacks)

- Lessons:
- 1) How to interact w/ the side panel (point and click ^{to get to diff tabs} or how to access text boxes Etc)
 - 2) How to interact w/ the environment (syntax)
↳ self.action (open drawer)

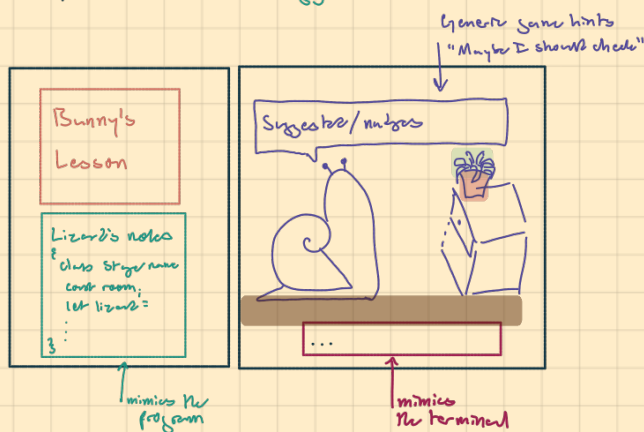

3) Objects

learns what objects are, and that they have fields you can access

4) Scope

Whether works best, either the value is looked for. Lizard does not have the right scope to access it → solution is to declare prev in scope and rewrite in some scope or the drawer is const so even though he has the key he can't change the value. Solution is changing to let

Keywords

Goal

How to achieve goal

Where action is done

Where action/Verification is done

• Clues/Actions:

1. Bunny's note mentions a ... was in "the drawer", where could that be?

- self.action ("look around room")

↳ auto-hints objects for you but in the future you will need to use them / it'll take more work / use in the future / something(?)

2. Figure out which drawer is locked

- maybe use sys0, but I think that should be saved for talking to other characters

- desk top drawer is locked; could locked drawer = desk top drawer;

↳ ~~locked~~ ~~locked~~

3. Bunny said the key to the drawer was under the plant pot

- self.search ("under", "plant pot");

↳ key object gets added to program

* tedious multi-parameter, one should have less "guidance" on what to type

Ble prev skills are badly reused

4. Open the drawer

- self.unlock (locked drawer, key);

↳ why objects as params

↳ returns FALSE, there is junk/something in the keyhole block the key from going in

- Journal "up 2x" to learn about let vs const (see's post it on table or something)

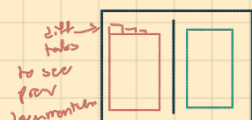

5. "Clear lock"

- let drawer = ~~~

↳ maybe "be careful" the let means something could change it (hint that adversary might change value)

- self.unlock (locked drawer, key)

↳ Success! Unlocks Bunny's Journal!

Maybe you can only have X1 snippets for a stage, so you are forced to remember how to do things or have to keep things bold?

another post it
↳ maybe little animation like click to unlock post it to entire readers to actually read it

Misc · ∇ ·

Skins!

- Each stage rewards you with an outfit item / money for an outfit item
So your lizard begins to look more like a detective over time
- Or like VI accessories → design at your checklist post its
- Tank / Humanity → very simple to add
