

UI "Pitch"

* You can find a more detailed example of how the user interacts with all the different boxes at the tutorial page

Goal

How to achieve goal

Where action is done

Where action / Verification is done

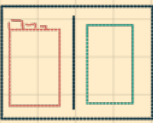

1 Bunny's Lesson

↳ This is where the text the user is supposed to learn from appears

- It's a part of the side panel, which mimics Bunny's notepad

* with

to see
prev
documentation

UI change?

mimics open book

A horizontal layout might be better than the vertical one in the example above

B/c the user needs a way to "flip back" to old lessons

But it doesn't really matter either way

Non-negotiables

- This feature is included, obviously, as it's how the user learns

- It's a part of the notepad side panel

- Some way to highlight / bring attention to a specific section

- new features can be "introduced" briefly during the "cutscenes" but most of the learning will occur during the investigation
so there should probably be some way of directing the user's attention to a specific lesson if it seems like they're stuck

when the story is being set up, and the
gameplay is mostly directed

2 Lizard's Notes

- Theoretically this section doesn't have to exist / need to be interactable w/ the user

It could function like a "word bank", in the sense that it stores previous acquired information, just in the form of a program or word bank instead of

* I do think this has to exist, b/c it provides the names and attributes (let's const) of the objects the player is interacting with

Essentially serving as a single source of truth

↳ Theoretically any code the user needs to change in the "program" could be done by having the user re-type the line into the "terminal" instead

↳ Honestly this might be a better approach, b/c it removes any confusion regarding where a line is supposed to be typed

There: Some documentation / reference needs to exist

so the user knows what to refer to / how they're supposed to

interact with the objects in the environment

- depending on how we intend for the user to interact w/ it, (word bank vs textbook) the user either fills in info or the program will generate it for them, after they use a command like `self.lookAround()`;

3 Lizard's Actions

- Where all / the majority of the typing will be

- Obviously needs to be included

- I think it should exist separate to the Lizard notes

- Personally I think it'd be nice to have it on the "main panel", not the side panel, b/c there's not much gameplay relevant stuff there (like the images / graphics aren't interactable). I think having the typing on a different screen to the notes / lesson would make it so everything isn't focused on the side panel

4 The idea is that the  is the lizard, and the  are its thoughts. Any general game direction (like the "current general task") the user is working towards could be here, so the user isn't focused on what they're supposed to be doing, just how to do it

* This is one place where hints could be conveyed

ex: `Bunny said the key was under the floor pot`
